

Map of Green Spaces in the City Center of Thessaloniki

In this personal project, the open green spaces in the city center of Thessaloniki, such as public parks, were mapped along with nearby parking locations for vehicular access. Additionally, the closest metro stations and public transit stops are displayed. This approach highlights all available access options for citizens, regardless of their preferred mode of transportation.

The map was developed using **QGIS** software, utilizing **OpenStreetMap** as the basemap, and coordinates were imported for precise location tracking. The Coordinate Reference System (CRS) used is **WGS84**, while distinct symbology was applied to differentiate public spaces, transit/metro stops, and parking locations.

This map serves as a significant tool for the city's Sustainable Urban Mobility Plan (SUMP), linking the use of public transport with access to parks. Furthermore, it accurately highlights areas that lack green spaces and experience an intense **Urban Heat Island (UHI)** effect. This raises critical concerns, prompting proposals such as the revitalization of abandoned plots. If that is not feasible, an alternative solution is the pedestrianization of secondary roads to create green corridors, thereby enhancing the residents' quality of life, reducing local pollution, and mitigating the urban heat island effect.
